SUMMARY OF VERSION 2.0 REVISIONS (JULY 2023)

The Manual for Retaining Wall and Noise Barrier Inspection, Version 1.0, March 2017 has been updated to Version 2.0, July 2023. The major changes are as follows:

- Updated the entire format of the manual to be consistent with other recently created Authority manuals. Updates include the addition of the Purpose, Roles and Responsibilities, Inspection Planning and Preparation, MPT Requirements, Retaining Wall and Noise Barrier Inspection Procedures, Element Level Inspection, Quality Control and Quality Assurance, Reporting of Emergency Deficiencies, Sample Routine, Damage and Interim Report, Retaining Wall and Noise Barrier Inventory sections and Typical Retaining Wall and Noise Barrier Sketches.
- The Preface was removed from the manual, and information previously in that section was relocated to a new report section (Purpose), to be consistent with other Authority manuals.
- The Introduction section was removed.
- Updated Types of Retaining Wall and Noise Barrier section to include additional types of retaining wall and noise barriers.
- Updated the structure inventory based on AWI query as per 07.17.2023.
- Included a table to list the number of retaining walls and noise barriers, distinguishing between standalone and extensions from a bridge in Section Purpose.
- Expanded on the inventory criteria for the retaining wall in Section 4.
- Updated Section 7 to include the latest requirements for reviewing the TCC presentation slides and signing of the acknowledgement form.
- Expanded on example of Category A1 defects and deficiencies requiring more frequent monitoring (Category E) in Section 9.

Please review this entire manual for additional revisions not listed above but included as part of the Version 2.0 revisions.

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

1. PURPOSE

The purpose of the New Jersey Turnpike Authority’s (Authority) Bridge Inspection Program is to inventory and document the physical characteristics, conditions and emergency/priority findings of all Authority owned structures including bridges, culverts, sign structures, retaining walls, noise barriers, high mast light poles (HMLP), and antenna towers. The data and information collected in the field during retaining wall and noise barrier inspections is utilized for the purpose of managing, maintaining, repairing, replacing, and monitoring the Authority’s retaining wall and noise barrier inventory.

Current Structures Included in the Authority’s Bridge Inspection Program		
New Jersey Turnpike Roadway

<u>Wall Inspection Total</u>	194	

* Structure Nos. MP 128.0B GY NE and MP 128.0B GY NW are currently being constructed under Contract No. P100.579

This Manual for Retaining Wall and Noise Barrier Inspection provides guidance for performing structural condition inspections and documenting the Authority’s inventory of retaining walls and noise barriers. This manual provides general information and the objectives of the retaining wall and noise barrier inspection program as well as standard definitions of wall types, structure limits, non-qualified walls, naming conventions, types of inspection, MPT requirements, quality control and quality assurance, sample reports and current retaining wall and noise barrier inventories. This manual also details the procedure to properly document the inventory and inspection data utilizing the Authority’s standard inspection and report forms in Bentley’s AssetWise Inspection (AWI) database, supplemented by field notes and photographs, as required. This manual does not address safety and work zone control requirements which are specified in the Authority’s Manual for Traffic Control in Work Zones under and Standard TP Drawings (<https://www.njta.com/doing->

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

[business/professional-services/publications/manuals/traffic-control](#)). Authority safety and work zone traffic control standards must be applied for all fieldwork which in turn must be performed by qualified and experienced engineering personnel and staff under an approved traffic permit and through the Authority's Lane Closing Application web-based program.

2. ROLES AND RESPONSIBILITIES

Refer to Section 4 of the Authority's Bridge Inspection Program Quality Management Plan (latest version) for specific roles and responsibilities of the Authority, the Bridge Inspection Program Technical Manager, and the Inspection Consultant, as they pertain to the inspection of retaining wall and noise barrier structures. Refer to Section 3 of this manual (Definitions) for the specific definitions, roles, and responsibilities of the Team Leader (TL) and Assistant Team Leader (ATL) performing inspection of the Authority's retaining wall and noise barrier structures.

3. DEFINITIONS

Refer to Section 3 of the Authority's Bridge Inspection Program Quality Management Plan (QMP) (latest version) for bridge inspection program definitions (https://www.njta.com/media/5606/2020-08-28-bi-program-quality-management-plan_v12-final.pdf).

The following definitions are specific to retaining wall and noise barrier structure inspections (and definitions for TL and ATL in QMP have been expanded upon):

Assistant Team Leader (ATL) – An individual of the Inspection Consultant assisting the Team Leader with planning, preparing and performing field inspection of a given retaining wall and/or noise barrier. (Refer to [New Jersey Turnpike Authority Bridge Inspection Program Qualifications of Key Bridge Inspection Personnel](#)).

Noise Barrier – A noise barrier is a structure designed to protect inhabitants of sensitive land use areas from noise pollution. Noise barriers are the most effective method of mitigating roadway noises during the passage of traffic. Noise barriers block the direct path of sound waves from the highway to homes and/or businesses along the highway. They do not eliminate noise; they only reduce the noise.

Non-Qualified Noise Barrier – A noise barrier measuring at least 8 feet in height and located within 25 feet from a bridge abutment, between the abutment joint and the first vertical construction joint, or constructed on a structure. Such noise barriers shall be associated with the nearby bridge and shall not be included in the Authority's noise barrier inventory. Non-Qualified Noise Barriers are inspected in conjunction with the nearby bridge and not as a standalone noise barrier, unless otherwise directed by the Authority. Refer to Section 4.D. for examples.

Non-Qualified Retaining Wall – Any retaining wall, with a maximum height of less than 4 feet measured from the existing grade to the top of the coping along the full length of the structure or located within 25 feet of a bridge abutment or between the abutment joint and the first vertical construction joint. Such walls shall be associated with the nearby bridge and shall not be included in the Authority's retaining wall inventory. Non-Qualified Retaining Walls are inspected in conjunction with the nearby bridge and not as a standalone retaining wall, unless otherwise directed by the Authority. Refer to Section 4.D. for examples.

Retaining Wall – A retaining wall is a structure designed to retain soil to a slope that it would not naturally keep to (typically a steep, near-vertical, or vertical slope). They are used to bound soils between two different elevations often in areas of terrain possessing undesirable slopes or in areas where the landscape needs to be shaped severely and engineered for more specific purposes such as roadway overpasses. Wall functions inventoried include fill walls, cut walls, switchback walls, bridge walls, and slope protection.

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

Support Staff (SS) – An individual of the Inspection Consultant supporting the Team Leader with the field inspection of a given structure. The support staff assists the TL performing inspections and can assist in the following inspection related tasks: taking and logging photographs, retaining wall and noise barrier measurements and movement of various inspection equipment (TMA or bucket truck) but is not considered qualified to perform any inspections.

Team Leader (TL) – An individual of the Inspection Consultant trained and certified and in charge of an inspection team who is ultimately responsible for planning, preparing, and performing field inspections, and can accurately evaluate and document findings of a given retaining wall and/or noise barrier (Refer to [New Jersey Turnpike Authority Bridge Inspection Program Qualifications of Key Bridge Inspection Personnel](#)). During the inspections, the Team Leader must be accompanied by at least one other team member which may include an ATL or SS.

4. TYPES OF RETAINING WALLS AND NOISE BARRIERS

Qualifications for retaining walls and noise barriers that will be included in the inventory and inspection program are provided herein.

Retaining walls measuring at least 4 feet in height at any location on the exposed vertical face from finished grade to the top of coping shall be inspected in accordance with this manual. In addition, they must be outside of the limits of the bridge wall as defined in Section 4.C.

The following are additional considerations:

- The minimum and maximum wall heights should be measured from the toe of the wall to the intended height of earth retention. For locations where the wall has been disturbed and/or retained materials have eroded, the wall height should be measured to a projected height of retention
- Although during the Retaining Wall and Noise Barrier Inspection Program the condition assessment will only address that portion of the wall that can actually be seen, there may be walls which are important to the stability of the roadway but may otherwise not qualify based on exposed height alone and may be included in the inspection program.
- Features such as parapets or integral Jersey barriers, which extend above the intended retained earth height of the wall, should not be included in the determination of maximum height. These features are evaluated as 'secondary wall elements' during the condition assessment and will be further evaluated in the context of their role as traffic barriers
- If any section of the wall satisfies the height criterion, the entire length of the wall should be included in the inventory, not just the segment that meets the criterion.

Retaining walls are commonly utilized throughout the Turnpike and Parkway roadways, ramps, at interchanges, and service areas.

A. TYPES OF RETAINING WALLS

i. Mechanically Stabilized Earth (MSE)

A segmental block mechanically stabilized earth wall is a composite structure consisting of alternating layers of compacted backfill and soil reinforcement elements, fixed to a wall facing.

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

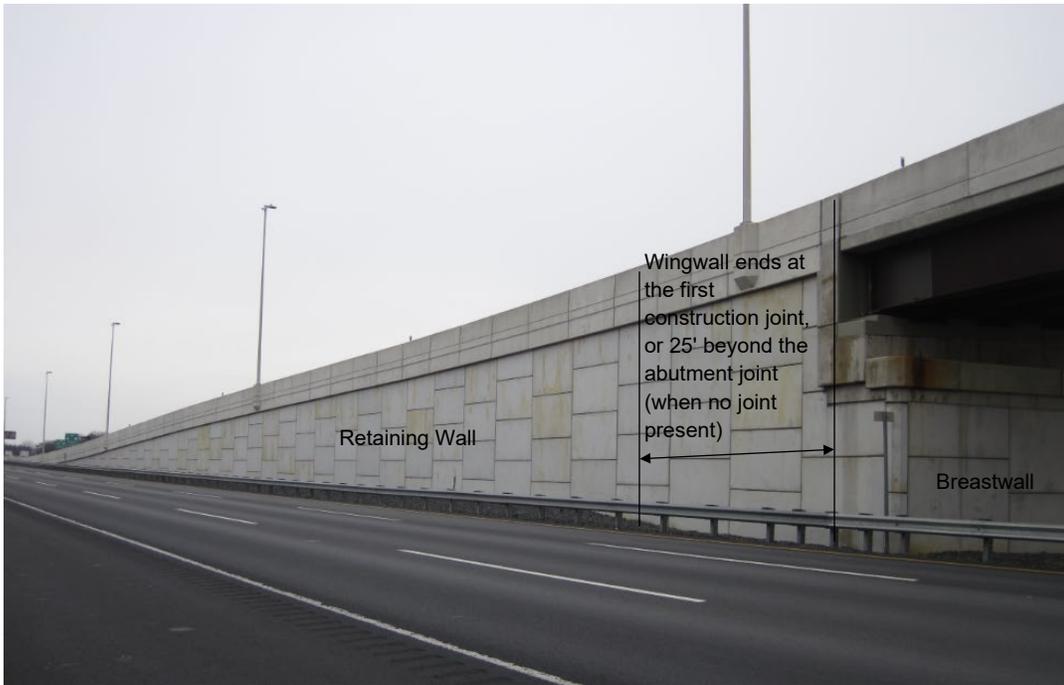

Photo 1 – Mechanically Stabilized Earth (MSE) Wall (Location – Turnpike SA7S Ramp NISA, MP 72.29NW)

ii. Reinforced Concrete

Reinforced Concrete wall is a cast-in-place (or precast) wall comprised of a reinforced concrete vertical stem cantilevered from a base slab.

Photo 2 – Reinforced Concrete Wall (Location – Turnpike SA8N Ramp SISA, MP 78.46SW)

iii. Steel Sheet Piling

Steel Sheet Piling wall consists of steel sheet piling structural sections with a vertical interlocking system that create a continuous wall. Sheet piles resist soil and water pressures by functioning as a beam spanning vertically between points of support.

Photo 3 – Steel Sheet Piling Wall (Location – Parkway S, MP 31.50S)

iv. Masonry

Masonry wall (Block Wall) consists of an assembly of masonry units joined together with mortar or grout.

Photo 4 – Masonry Wall (Block Wall) (Location – Parkway S, MP 131.10S)

v. Timber Sheeting

Timber Sheeting wall consists of timber structural sections fastened together with vertical tongue and groove boards, horizontal walers, piles, top cap boards, tie rods, and deadmen.

Photo 5 – Timber Sheeting Wall (Location – Parkway S, MP 2.4S NW)

vi. Plastic Sheeting

Plastic Sheeting wall consists of plastic sheet piling structural sections fastened together with timber horizontal walers, piles, top cap boards, tie rods, and deadmen.

Photo 6 – Plastic Sheeting Wall (Location – Parkway N, MP 0.5N SE)

vii. Cribwall

A cribwall is comprised of precast reinforced concrete logs (cribbing) that are assembled like a mini log cabin. Stretchers run parallel with the wall face, while headers run perpendicular to the wall face.

Photo 7 – Cribwall (Location – Parkway S, MP 149.4S)

viii. Gabion

Gabion walls are made up of gabions, or large cages or baskets, which are filled with rocks, gravel, concrete, or leftover construction materials. These large baskets can be stacked together and connected using heavy-duty wire.

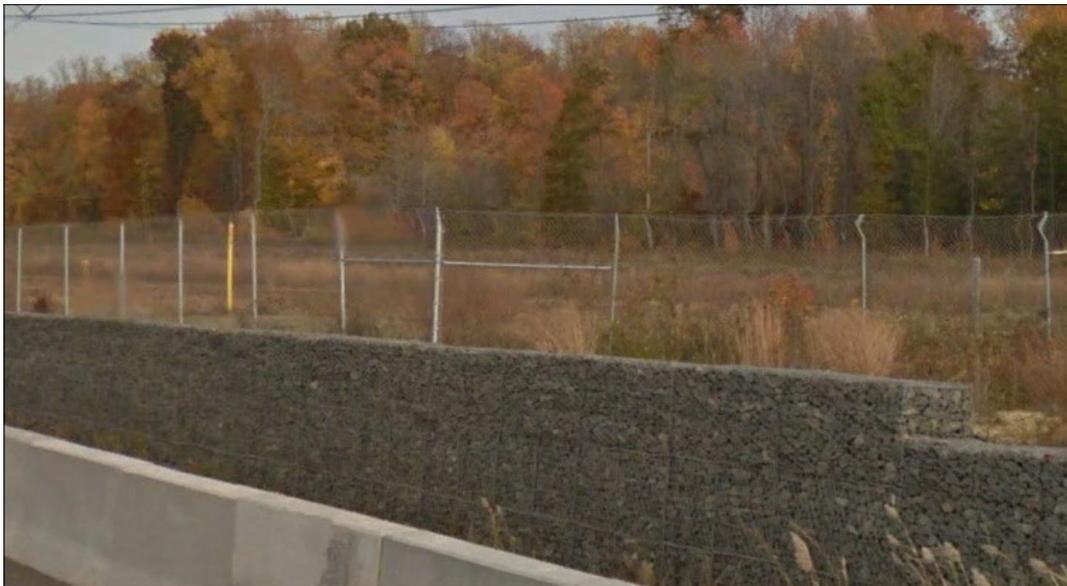

Photo 8 – Gabion Wall (Location – Turnpike SNO, MP 52.1NO)

ix. Post and Panel

A Post and Panel wall is a structurally engineered, prefabricated/precast reinforced concrete retaining wall system. The system utilizes concrete or steel posts to interlock with the reinforced concrete wall panels.

Photo 9 – Post and Panel Wall (Location – Turnpike Ramp ST, MP 53.75ST)

x. Other/Combination

Other/Combination wall includes unique types of retaining wall systems such as steel sheet pile with concrete facing, soldier pile wall, timber lagging and precast lagging panels, and prefabricated modular wall panels with barrier.

Photo 10 – Other/Combination Wall Soldier Pile Wall (Location – Turnpike SNO, MP 56.62NO)

(Location – Turnpike NSO, MP 69.3NO)***

***Photo 14 – Other/Combination Wall Prefabricated Modular Wall Panels with Barrier
(Location – Turnpike SA7S Ramp SAS, MP 71.72SAS)***

B. TYPES OF NOISE BARRIERS

Noise barriers measuring at least 8 feet in height along the exposed vertical face from grade (or base of noise barrier when mounted atop retaining walls) to top of barrier, shall be included as a structure in the Authority's inventory and inspection program.

See below for types of Authority noise barriers:

i. Post and Panel

A Post and Panel noise barrier is a structurally engineered, prefabricated system which consists of separate reinforced concrete panels placed between supporting columns or steel posts.

Photo 15 – Post and Panel Noise Barrier (Location – Turnpike SNO, MP 99.87NO)

ii. Reinforced Concrete

Reinforced Concrete noise barrier is a cast-in-place (or precast) noise barrier comprised of a reinforced concrete vertical stem cantilevered from a base slab.

Photo 16 – Reinforced Concrete Noise Barrier (Location – Turnpike SNO, MP 100.45NO NE)

iii. Other/Combination

Other/Combination noise barrier types include wall systems utilized together (i.e. noise barrier constructed on top of a retaining wall).

Photo 17 – Other/Combination Noise Barrier Post and Panel Noise Barrier on Top of the MSE Wall (Location – Turnpike NSO, MP 54.00SO SW)

C. STRUCTURE LIMITS AND CONSIDERATIONS

The Authority's wingwalls and retaining walls are typically constructed with contraction joints spaced at 30 feet and expansion joints spaced at 90 feet. Expansion joints typically exist between the end of the wingwall and the beginning of the retaining wall. The location of these expansion joints should be utilized to determine the start (or end) of the retaining wall. In some situations, a contraction joint may not be present to help determine the end of the wingwall and beginning of the retaining wall. Wingwall and retaining wall construction types that may lack a contraction joint may include but are not limited to reinforced concrete, MSE and other/combination wall types. The abutment footing is typically one foundation mat (with or without piles) supporting both the abutment wall (i.e. the breastwall) and the wingwalls whereas the retaining wall footing is typically constructed independent from the abutment footing. Since the footings are below grade and there is no visible joint, the end of wingwall and the start of the retaining wall shall be estimated at 25 feet beyond the abutment joint.

The Begin and End MP of the retaining wall or noise barrier are defined by direction of traffic.

The retaining walls shall be inventoried and inspected for the full length, as long as any exposed vertical face from grade to the top of the coping, meets or exceeds a minimum height of 4 feet.

All barriers constructed in front and/or on top of the retaining wall shall be inspected as an element of the retaining wall. All barriers constructed in front of the noise barrier shall be inspected as an element of the noise barrier.

The following guidelines shall be utilized to determine the limits (Begin and End) of an Authority retaining wall or noise barrier asset:

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

1. When the retaining wall extends from the bridge substructure and the joint between the retaining wall and the bridge wingwall is visible, the limits of the retaining wall (Begin MP) shall be considered to start at that visible joint. The total length of the retaining wall shall be measured from the joint to the end of the wall [See Figure 1].

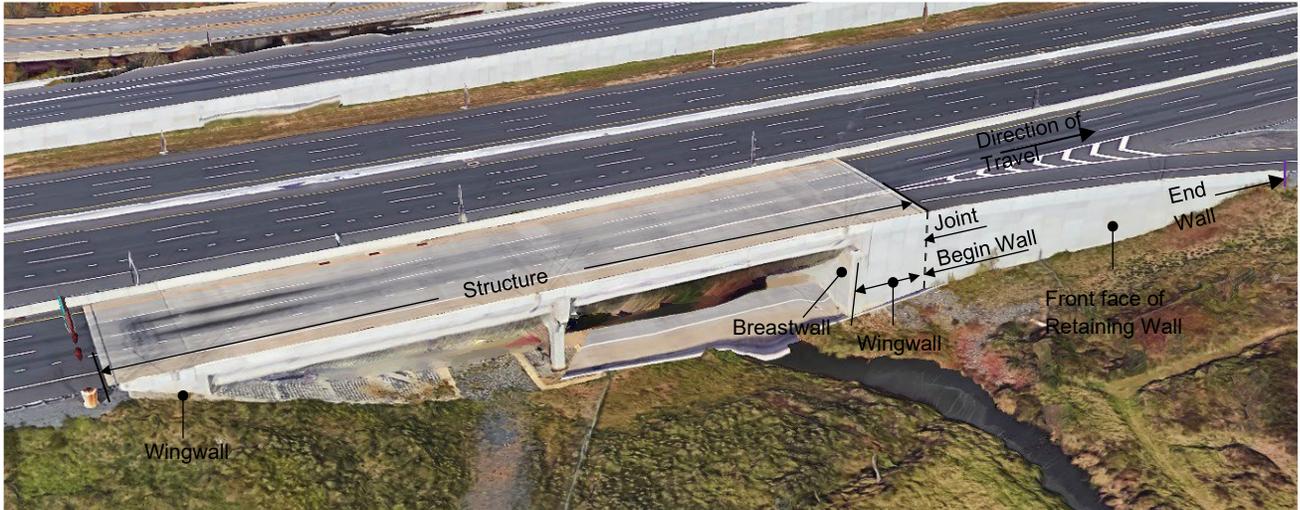

Figure 1-Begin and End of Retaining Wall (Visible Joint)

2. When the retaining wall extends from the bridge substructure and the joint between the retaining wall and the bridge wingwall is not visible, the retaining wall (Begin MP) shall be considered to start 25 feet from the abutment joint. The total length of the retaining wall is measured from the established beginning of the wall to the end of the wall. The initial 25 feet of the wall (considered as the wingwall) is included in the associated bridge or culvert inspection and should not be inventoried or inspected as a retaining wall. [See Figure 2].

Figure 2-Begin and End of Retaining Wall (No Visible Joint)

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

3. When a retaining wall exists between two structures with no visible joints between the wingwalls and retaining wall, the retaining wall (Begin MP) shall start 25 feet from the abutment joint of Structure No. 1 and shall end (End MP) 25 feet from the abutment joint of Structure No. 2. [See Figure 3]

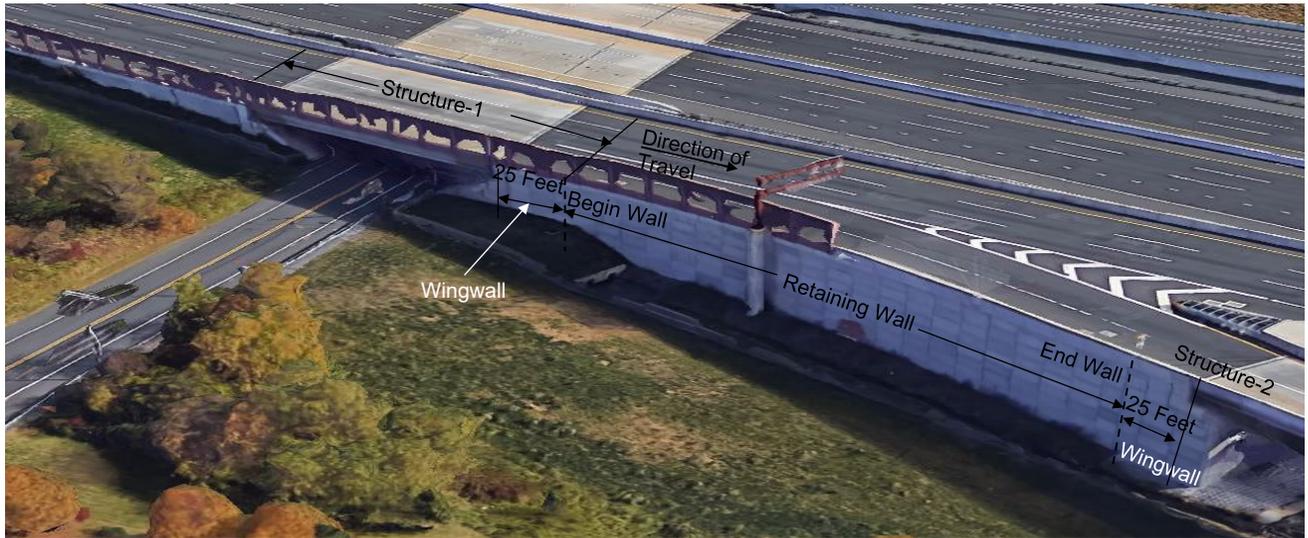

Figure 3-Begin and End of Retaining Wall Between Two Structures

4. When a standalone retaining wall is located along the Turnpike and Parkway roadways, the beginning of the retaining wall (Begin MP) shall be the first point encountered while traveling in the direction of traffic and the end of the wall shall be at the termination of the wall. [See Figure 4]

Figure 4-Standalone Retaining Wall (along Mainline shown)

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

5. When a noise barrier and retaining wall are present, the retaining wall and noise barrier shall be inventoried and inspected as one combined structure and shall be designated a noise barrier. The beginning of a noise barrier is the first point encountered while travelling in the direction of traffic and the end of the noise barrier is at the termination of the noise barrier. **[See Figure 5]**

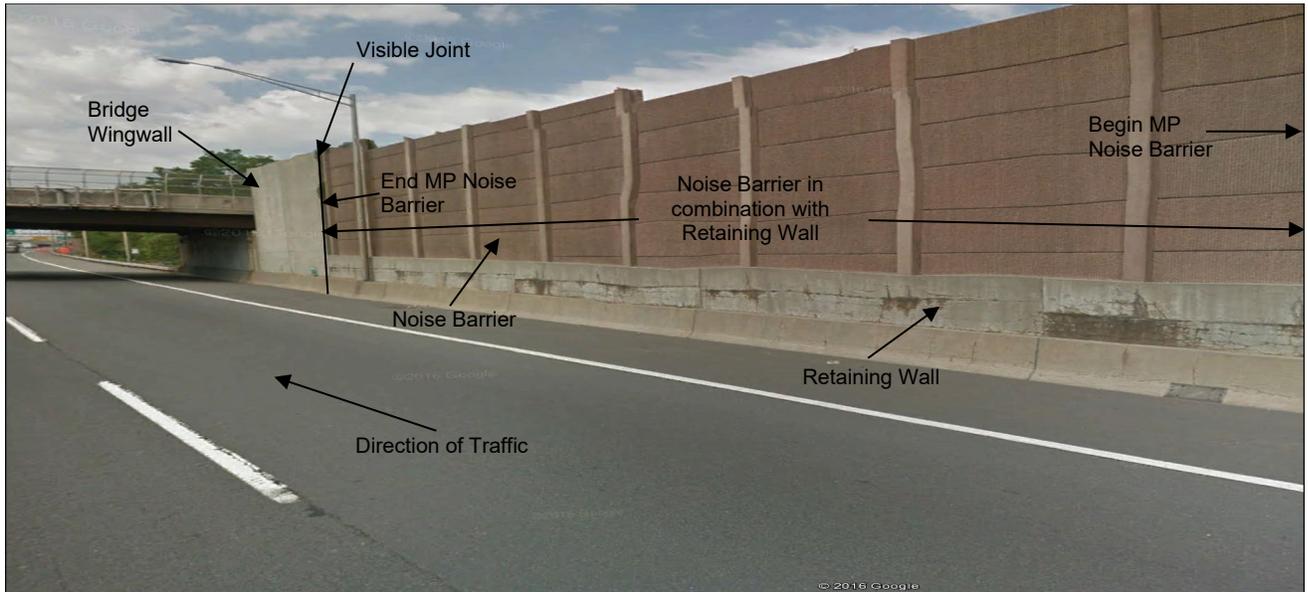

Figure 5-Combination of Noise Barrier and Retaining Wall

D. NON-QUALIFIED RETAINING WALLS OR NOISE BARRIERS

Non-Qualified retaining walls or noise barriers generally meet the geometric criteria for designation as a retaining wall or noise barrier, but due to their proximity to an adjacent bridge, are inspected under the Authority’s bridge inspection program. Refer to Section 3 for applicable definitions.

Following are examples of non-qualified retaining walls and noise barriers:

- Wingwall extending 25 feet from a bridge abutment shall be inspected with the bridge and therefore is considered a non-qualified retaining wall.
- Median barriers between adjacent roadways and walls or barriers in front of bridge abutments acting to retain soil shall be considered non-qualified retaining walls, shall be inspected with the bridge, and are considered non-qualified retaining walls. **[See Figure 6 and Figure 7]**
- Noise barriers on top of a wingwall that are located within 25 feet from bridge abutment joints shall be inspected with the bridge and are considered non-qualified noise barriers. **[See Figure 8]**

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

Figure 6- Median Barrier Between Outer and Inner Roadways

Figure 7- Wall in Front of Abutment

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

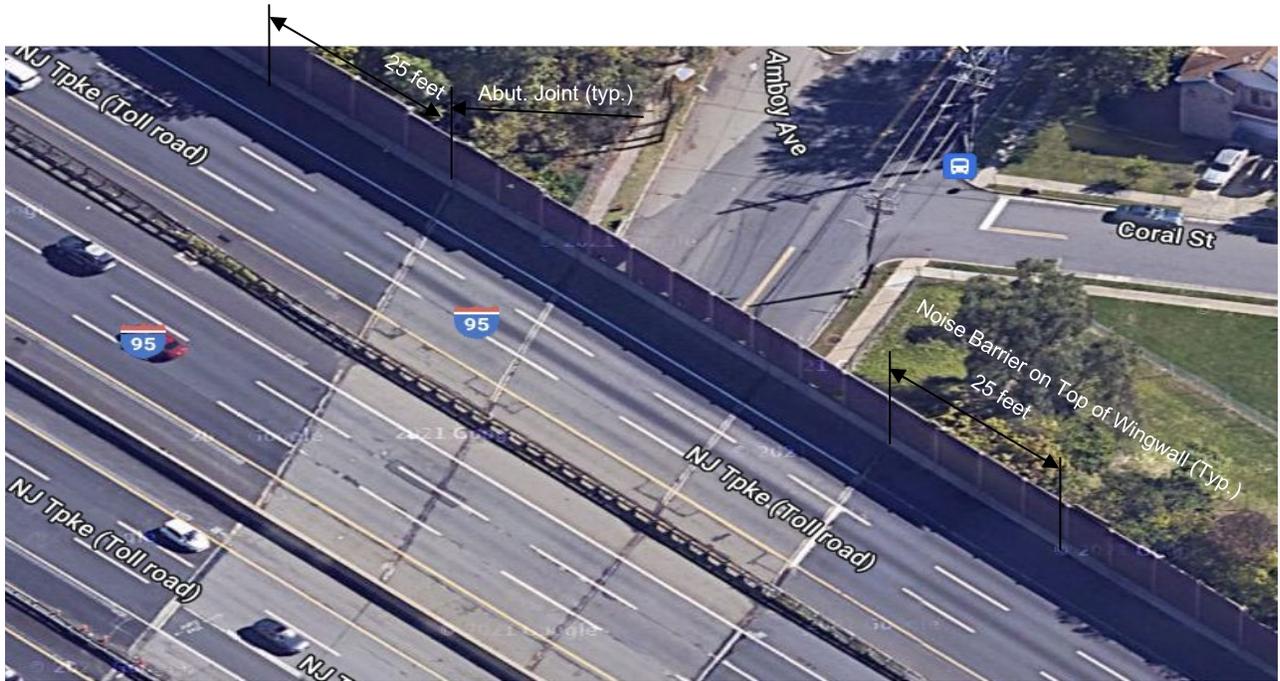

Figure 8- Noise Barrier on Top of Wingwall and Structure

E. STRUCTURE NUMBER (ASSET NAME) AND STRUCTURE NAME (ASSET CODE)

The Structure Number and Structure Name for retaining wall and noise barrier assets shall be determined based upon the following Authority requirements.

For mainline and ramp structures, the Structure Number for a standalone retaining wall or noise barrier shall be the beginning milepost of the structure in the direction of travel followed by the roadway (NS, NSO, NSI, SN, SNO, SNI, SBE, SBEA, NBX, NBE, NW, NE, SW, SE, SAN, etc.).

The Structure Name for a standalone retaining wall or noise barrier is the roadway designation and the Begin MP in direction of traffic documented to the hundredth of a mile (XX.XX). **[See Figures 9 and 10]**

For mainline, ramp, local roadway, service road, or pedestrian bridge, the Structure Number for a retaining wall or noise barrier extending from a bridge shall be the bridge structure number and shall include a directional reference (NE, SE, NW, SW) based on the corner of the bridge where the wall is located.

The Structure Name for the retaining wall or noise barrier which are extensions of a bridge structure shall include the roadway designation and the bridge structure number with a direction reference based on the corner of the bridge where the wall is located (NE, SE, NW, SE). **[See Figures 11 and 12]**

All roadway designations can be found in the NJTA Manual for Traffic Control in Work Zones: https://www.njta.com/media/1501/njta_traffic_control_manual_in_work-zones_122016.pdf

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

Structure Number and Structure Name Examples:

1. The Structure Number (Asset Name) for a standalone noise barrier located along the Turnpike SNO Roadway at Begin MP 81.78 is MP 81.78NO. The corresponding Structure Name (Asset Code) for the noise barrier is Turnpike SNO MP 81.78. **[See Figure 9]**

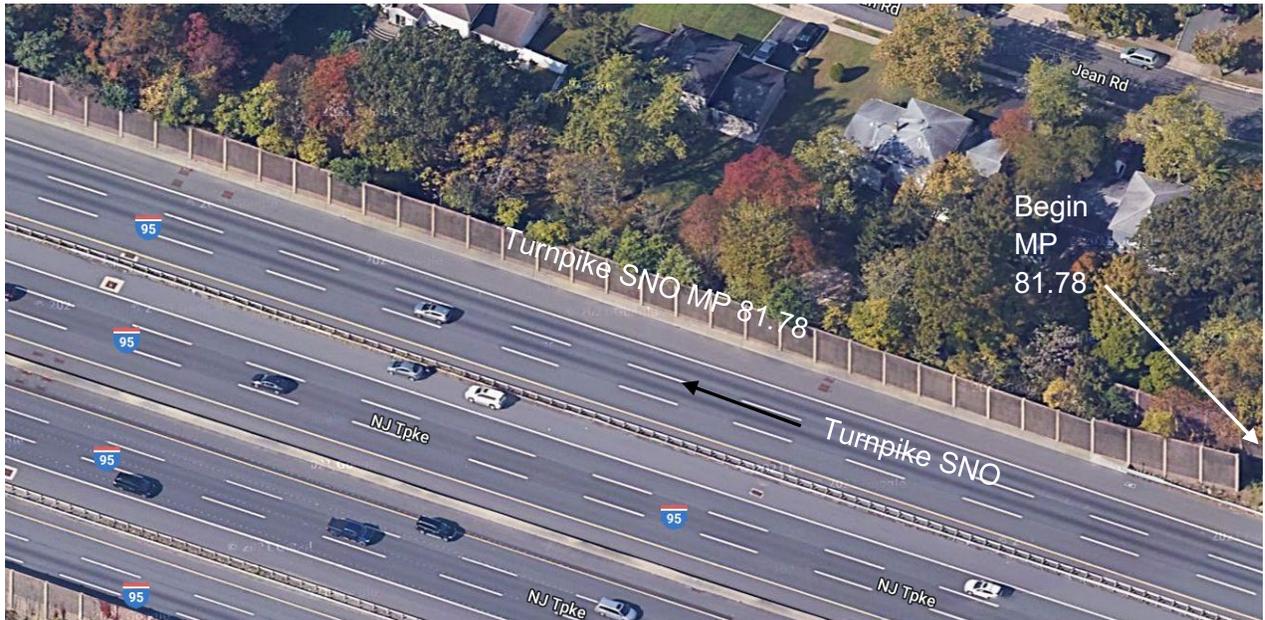

Figure 9 – Noise Barrier Along Turnpike Mainline

2. The Structure Number (Asset Name) for a retaining wall or noise barrier on Ramp NBX at Interchange 10 with Begin MP of 9.62 is MP 9.62NBX. The corresponding Structure Name (Asset Code) for the retaining wall is Parkway Ramp 10NBX MP 9.62. **[See Figure 10]**

Figure 10 – Retaining Wall or Noise Barrier at Parkway Ramp

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

3. The Structure Number (Asset Name) for a retaining wall extending from a bridge located along the Turnpike Mainline Roadway at Bridge No. 50.43SO and supporting the NSO Roadway at the northwest corner is MP 50.43SO NW. The corresponding Structure Name (Asset Code) for this retaining wall is Turnpike NSO MP 50.43SO NW. The retaining wall supports the fill for the Turnpike roadway. **[See Figure 11]**

Figure 11 – Retaining Wall at Extension of Mainline Bridge (Turnpike Shown)

4. The Structure Number (Asset Name) for a retaining wall or noise barrier extending from local road over bridge MP 71.26R, Cranbury-Half Acre Road at the northwest corner is MP 71.26R NW. The corresponding Structure Name (Asset Code) for the retaining wall is Cranbury-Half Acre Road MP 71.26R NW. **[See Figure 12]**

Figure 12 – Retaining Wall at Extension of Local Road Over Bridge

5. INSPECTION PLANNING AND PREPARATION

A. QUALIFICATIONS

Key project personnel shall possess relevant training and experience demonstrating:

- i. Successful completion of National Bridge Inspection Standards (NBIS) inspections of retaining walls and/or noise barriers, effective inspection scheduling, and report preparation and submission.
- ii. TLs performing retaining wall and noise barrier inspections must meet the following requirements for experience in addition to the requirements outlined in the document “Qualifications of Key Bridge Inspection Personnel” on the Authority’s website at <http://www.njta.com/doing-business/njta-bridge-inspect-program> under the heading “NJTA Bridge Inspection Program” and as summarized on the NJTA Bridge Inspection Qualification Summary Form QAF3 – Consultant Qualification Form.

TLs who are registered professional engineers shall have a minimum of one year of retaining wall and noise barrier inspection experience. A minimum of two years of prior inspection experience is required without a PE.

- iii. ATLs performing retaining wall and noise barrier inspections must meet the following requirements for experience in addition to the requirements outlined in the document within “Qualifications of Key Bridge Personnel” on the Authority’s website at <http://www.njta.com/doing-business/njta-bridge-inspect-program> under the heading “NJTA Bridge Inspection Program” and as summarized on the NJTA Bridge Inspection Qualification Summary Form QAF3 – Consultant Qualification Form.

ATLs shall have one year of prior retaining wall and noise barrier inspection experience.

- iv. There are no qualification requirements for SS.

B. TEAM COMPOSITION

All inspection teams must consist of a minimum two-person crew and include a TL, and an ATL and/or SS. An inspection team may consist of any of the following three combinations: TL with ATL, TL with ATL and SS, or TL with SS.

C. INSPECTION DOCUMENTATION REQUIREMENTS

A successful retaining wall and noise barrier inspection requires that the inspection team have on-hand all available design and inspection documents such as construction contract

plans (if available), and previous inspection reports related to the structure being inspected. These documents will aid the inspection team in determining as-built conditions and any changes in previously reported conditions or deficiencies. Refer to the standard retaining wall and noise barrier inspection forms and the sample report included in Section 12. These documents show the fields needed to collect data and information to be included in the inspection reports.

D. STANDARD RETAINING WALL AND NOISE BARRIER INSPECTION EQUIPMENT

The inspection team may be required to have any or all of the following equipment on hand when performing retaining wall and noise barrier inspections, depending on the details and location of the retaining wall and noise barrier being inspected:

- Refer to the work zone traffic control requirements which are specified in the Authority's Manual for Traffic Control in Work Zones (<https://www.njta.com/doing-business/professional-services/publications/manuals/traffic-control>) and includes discussion of the proper use of Truck Mounted Attenuators, signs, traffic cones and flags, flashing amber lights on vehicles on the roadway, and identification for vehicles located within the Authority's Right of Way
- Personal Protective Equipment including hard hats, reflective high visibility vests, eye protection, gloves, safety harnesses and lanyards
- Basic access equipment such as step ladders and extension ladders
- Tools for cleaning including whisk brooms, wire brushes, scrapers, shovels, and brooms
- Tools for inspection including sounding hammers, high power binoculars, and flashlights
- Tools for measuring including plumb bobs, protractors, levels, folding rulers, calipers, measuring tapes, or laser measuring devices
- Digital camera
- Marking utensils such as keel or lumber crayons
- First Aid kit

E. SCHEDULE MANAGEMENT

The inspection consultant shall submit a general schedule showing the dates for the milestone tasks in the project to the Authority at the beginning of the project. A comprehensive schedule (master inspection and report submission schedule) showing anticipated dates for inspection, data input, preliminary and final report submission, comments received, QA/QC dates along with additional comments shall be created by the inspection consultant and will be used to track the progress of the project. In addition, an updated version of the comprehensive schedule shall be submitted to the Authority and Bridge Inspection Program Technical Manager (BIPTM) monthly before the 7th day of each month.

F. ASSETWISE INSPECTION (AWI) ACCESS REQUEST FORMS

The inspection consultant shall complete the AssetWise Inspection (AWI) access request forms provided by the BIPTM via email and return to the BIPTM (AWI administrator) for project staff to obtain access to AWI.

G. PROJECT SPECIFIC QA/QC PLAN

A project specific QA/QC plan, as defined in the Authority's Bridge Inspection Program Quality Management Plan, shall be submitted to the Authority for review and approval.

6. TYPES OF INSPECTION

A. INVENTORY

The initial inspection cycle will include a visual inspection of all primary structural elements, secondary elements, and appurtenances comprising the retaining walls and noise barriers, including but not limited to wall facing / panel, foundation, anchorage and connection, vertical supports, joints, guide rail, barriers, roadways, and drainage elements, for deficiencies including ground settlement, roadway settlement, crack patterns, rutting, gaps at parapet asphalt interfaces, and vegetation growth in joints. If conditions are detected adversely affecting the safety of the public and/or the structure integrity of the wall, a hands-on inspection shall be performed. The initial inspection includes collecting structure inventory data which will be entered into the AssetWise Inspection (AWI) database. The required inventory items include but are not limited to the following: Begin and End Wall MP, GPS Coordinates, Length, Maximum and Minimum Heights, As-Built contract and Shop Drawing details, features in front, on top, and behind wall, and foundation and backfill details. Standard sketches shall be used to document the structure dimensions during the field inspection and will be available to download from AWI (NJTA Retaining Wall/Noise Barrier Field Sketch) via <https://njta-it.bentley.com/documentation.aspx> and refer to Section 14 of this manual.

B. ROUTINE

A routine inspection, performed at an approximate six-year frequency, includes a close visual inspection of all primary structural elements, secondary elements, and appurtenances of the retaining walls and noise barriers including but not limited to wall facing / panel, foundation, anchorage and connection, vertical supports, joints, guide rail, barriers, roadways, and drainage elements. This inspection consists of collecting and/or verifying the structure inventory items and entry into AWI. If a structure inventory error is found, the BIPTM shall be notified to review the error and approve the proposed change prior to the inventory update. The element defects must also be documented and assessed for repair needs. Prior notes of deficiency shall be reviewed and commented for changes (measured and quantified). A sketch depicting overall dimensions shall be field verified and updated if required.

C. SPECIAL

A special inspection is a unique inspection effort targeted at special situations or conditions and may be performed to study a unique or unusual structural feature in greater detail than would have normally occurred during a routine inspection. Special inspections encompass a 100% hands-on inspection of specific components, details, or deficiencies which need special monitoring and/or evaluation. In planning a special inspection, the TL shall understand the goal of the inspection to help determine the equipment and traffic control needed to obtain the necessary condition information for the elements requiring inspection. Examples of special inspections, and their definitions, include, but are not limited to the following:

- *Post Storm Inspection*: Inspection of a structure subsequent to extreme weather conditions such as a hurricane or high wind events in order to determine the onset or advancement of any documented damage.
- *Structural Detail Inspections*: Inspection of structural details, components and/or materials that have been previously or recently identified to typically exhibit advanced displacement, spalling, cracking, or other signs of distress, which may result in potential failure and warrant additional inspections.

D. DAMAGE

This is an unscheduled inspection of a retaining wall and noise barrier that has been damaged by an event such as a motor vehicle accident (MVA), including but not limited to vehicular impact to a foundation, vertical supports, and wall panels.

E. INTERIM

This is an inspection scheduled at the discretion of the individual in responsible charge of retaining wall and noise barrier inspection activities. An Interim Inspection is used to monitor a particular known or suspected deficiency (e.g., foundation settlement or scour, member condition, etc.) and can be performed by a qualified person familiar with the retaining wall and noise barrier. The determination of an appropriate Interim Inspection frequency should consider the severity of the known deficiency.

7. MPT REQUIREMENTS

A. LANE/SHOULDER CLOSURE

All closures along the Turnpike and Parkway Roadways must be approved by the Authority's Operations Department. Retaining wall and noise barrier inspections performed along the Turnpike and Parkway Roadways shall be performed behind guide rail or other existing roadside barriers, where feasible. When work must be conducted in a closed lane or shoulder, the Inspection Consultant shall provide traffic control in accordance with the current edition of the Authority's Manual for Traffic Control in Work Zones. **The Inspection Consultant shall also provide traffic control on local and state roads in accordance with the governing agency's requirements.**

B. TRAFFIC PERMIT

A Traffic Permit is required for any work within the Authority Right of Way. The Traffic Permit Application form and instructions can be found online at the Authority's website: <https://www.njta.com/about/traffic-permits>. Applicants for the Traffic Permit are required to review the Temporary Traffic Control Safety Class presentation slides prepared by the State Police in conjunction with the Authority to become familiar with lane/shoulder closure and work zone procedures. After reviewing these slides, applicants must sign an acknowledgement form to confirm that they have completed the review and agree to abide by all rules and regulations pertaining to work on the New Jersey Turnpike and Garden State Parkway.

Note, the Authority requires that a daily lane or shoulder closing be installed by Maintenance or an approved vendor for any inspections which require more than 1-hour duration along the mainline and for any ramps. The Maintenance Department may accommodate a closing for up to 5 miles long depending on location and other work being performed on the roadway.

For additional information refer to the Authority's Manual for Traffic Control in Work Zones: https://www.njta.com/media/1501/njta_traffic_control_manual_in_work-zones_122016.pdf

C. DAILY LOCATION NOTIFICATION

In addition to submitting requests for lane or shoulder closures to the NJTA via the Lane Closure Request System (<https://tplc-v2.newjerseyturnpike.com/>). Team Leaders are required to email a Bridge Inspection Location (BILOC) notification to the BIPTM and the Authority daily and before commencing field work. The BILOC shall consist of the following information:

OPS: XXXX

Retaining Wall or Noise Barrier

Roadway: Parkway or Turnpike

MP (use exact Asset Name in anticipated order):

Team Leader last name:

Cell Phone:

MPT (indicate location where closing is and reason):

8. RETAINING WALL AND NOISE BARRIER INSPECTION PROCEDURE

The procedure for inspection of retaining walls and noise barriers is similar for all structure types and locations. The inspection shall include the wall panels, vertical supports, construction/expansion joints, visible foundations, anchorages, connections, guide rails, barriers, right of way security, and elements mounted on top of the asset, such as fences, lighting standards, and junction boxes.

The inspector shall perform a visual inspection of all visible components of the retaining wall or noise barrier. When defects are identified on the face of the retaining wall or noise barrier, the wall panels shall be sounded utilizing a ladder or bucket truck with TMA in a daily or short duration shoulder closure, if required for access. The retaining wall or noise barrier shall be inspected to ensure the plumbness of the wall. Document defects in the right-of-way fencing, roadway, guide rail, and barrier atop and along the wall, lighting standards and junction boxes, visible utilities, and identify potential drainage issues.

MINIMUM REQUIRED PHOTOGRAPHS

- General view of the front of the retaining wall and/or noise barrier (looking in direction of traffic)
- General view of the rear of the retaining wall and/or noise barrier or Top of roadway supported by the retaining wall
- Category A photos: A1, A2, A3, GR, Utility
- Equipment and MPT used for access/traffic control
- All Defect photos (in order of field notes)
- Work on-going or completed

9. INSPECTION ELEMENTS AND OVERALL RETAINING WALL AND NOISE BARRIER CONDITION ASSESSMENT

A. INSPECTION ELEMENTS

Based on the type of retaining wall or noise barrier, record the element defects, quantity, and location of defects along with a photo reference for all repairable defects (Category A or B) or defects requiring monitoring (Category E). Inspect the exposed front face of the retaining wall or noise barrier, vertical supports, exposed foundations, anchors, guide rail protection as well as barriers and/or fencing mounted to the wall.

Following is a general list of typical defects to be documented during the inspection of Reinforced Concrete, Post and Panel, and Mechanically Stabilized Earth Retaining Walls:

- Abrasion/Wear
- Alkali-Silica Reactivity (ASR)
- Bulging
- Cracking/Scaling/Fracture
- Debris Accumulation
- Delamination/Patched Area
- Distortion
- Efflorescence/Rust Staining
- Erosion
- Freeze-thaw Damage
- Grade Settlement Along the Wall
- Graffiti
- Horizontal Rotation
- Leaching
- Leakage
- Scour
- Separation
- Settlement
- Spalling with or without Exposed Rebar
- Vegetation Growth
- Vertical Rotation

Following is a general list of typical defects to be documented during the inspection of Steel Sheeting Retaining Walls:

- Abrasion/Wear
- Bulging
- Corrosion/Section Loss

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

- Cracking
- Damage
- Debris Accumulation
- Distortion
- Erosion
- Grade Settlement Along the Wall
- Graffiti
- Horizontal Rotation
- Leakage
- Paint Peeling
- Scour
- Separation
- Settlement
- Vegetation Growth
- Vertical Rotation

Following is a general list of typical defects to be documented during the inspection of Timber Sheeting Retaining Walls:

- Abrasion/Wear
- Bulging
- Cracking
- Damage/Fire Damage
- Debris Accumulation
- Decay/Rot/Heart Rot
- Distortion
- Erosion
- Grade Settlement Along the Wall
- Graffiti
- Horizontal Rotation
- Insect Damage/Timber Borers
- Scour
- Separation
- Settlement
- Split/Checks/Shakes
- Vegetation Growth
- Vertical Rotation
- Weathering

Following is a general list of typical defects to be documented during the inspection of Masonry Retaining Walls and Cribwalls:

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

- Bulging
- Cracking
- Damage
- Debris Accumulation
- Displacement
- Efflorescence/Rust Staining
- Freeze-thaw Damage
- Grade Settlement Along the Wall
- Graffiti
- Horizontal Rotation
- Leakage
- Mortar Breakdown/Missing Mortar
- Scour
- Separation
- Settlement
- Spall/Fractures
- Vegetation Growth
- Vertical Rotation

B. CONDITION ASSESSMENT OF ELEMENTS AND QUANTITY ESTIMATES

The deficiencies listed in Section 9.A. and Table 1 are provided in this manual for general understanding during inspection. The definitions are referenced from Chapter 7 (Materials, Material Deficiencies and Inspection Methods) of the Bridge Inspector’s Reference Manual. For the detailed description of each definition, it is recommended to refer to Chapter 7 (Materials, Material Deficiencies and Inspection Methods) of Bridge Inspector’s Reference Manual.

TABLE 1. DEFICIENCIES AND DEFINITIONS

Deficiency	Definition and Unit of Measurement
Abrasion/Wear	Abrasion damage is the result of external forces acting on the surface of concrete member and is similar to wear. Wear is the gradual removal of surface mortar due to friction and occurs to concrete surfaces. Advanced wear exhibits polished aggregate, which is potentially a safety hazard when the deck is wet. (PERCENTAGE)
Alkali-Silica Reactivity (ASR)	It is an expansive reaction forming a gel, which will result in the swelling and expansion of concrete. The process involves a reaction between potassium and sodium alkalis and silica. Alkali found in soils, deicers and chemical treatments could also contribute to ASR.
Bulging	A rounded protrusion or bend in a section of a wall. (INCH)

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

TABLE 1. DEFICIENCIES AND DEFINITIONS

Deficiency	Definition and Unit of Measurement
Checks	Separation of the wood fibers, normally occurring across or through the annual growth rings, and generally parallel to the grain direction. (EACH)
Collision Damage	A vehicle, railroad car, and/or marine traffic strikes a structure. (LOCATION)
Connections	All connections should be closely inspected for tightness, cracks at fasteners connecting members and/or for missing connection. (EACH)
Corrosion	Corrosion is the primary cause of section loss in steel members and is most commonly caused by the wet-dry cycles of exposed steel. When deicing chemicals are present, the effect of corrosion is accelerated. (SQUARE FEET)
Cracking	A crack is a linear fracture in structural material. Structural cracks are caused by dead load and live load stresses. (LINEAR FEET)
Damage	A structural damage that occurs due to environmental factors or human actions.
Debris Accumulation	Accumulation of material including floating wood, trash, suspended sediment, or bed load moved by a flowing stream. (LOCATION)
Decay (Timber Section Loss)	Decay is the process of living fungi, which are plants feeding on the cell walls of wood. Decay is the primary cause of timber replacement. (EACH)
Delamination	Delamination occurs when layers of concrete separate at or near the level of the outermost layer of reinforcing steel. (SQUARE FEET)
Distortion	Alteration or deformation of the structural element from its original state can occur due to a variety of factors, not limited to overloads, material degradation, foundation issues, and possible as-built conditions.
Efflorescence	The process of cracking permits moisture absorption and increased flow within the concrete that is evidenced by dirty-white surface deposits called efflorescence. (SQUARE FEET)
Erosion	Wearing away of soil by flowing water. (CUBIC YARD)
Exfiltration	Exfiltration occurs when leaking joints allow water flowing through the wall to leak into supporting material. (PER LOCATION)
Fire Damage	Extreme heat will damage concrete. High temperatures will cause a weakening in the cement paste and lead to cracking.
Freeze-thaw Damage	Freeze-thaw is the freezing water within the capillaries and pores of cement paste and aggregate resulting in internal oversteering of the concrete, which leads to deterioration including cracking, scaling, and crumbling. (INCH)

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

TABLE 1. DEFICIENCIES AND DEFINITIONS

Deficiency	Definition and Unit of Measurement
Graffiti	Any form of paint vandalism that is added to the wall after construction has been completed. (SQUARE FEET)
Gap	Space between the base of the parapet and adjacent pavement surface due to differential settlement of the parapet or asphalt, or erosion of the underlying soil. (INCH)
Horizontal Rotation	The movement of the wall where it is angled from a certain point length wise. (DEGREES)
Insect Damage/Marine Bores	Insects tunnel in and hollow out the insides of timber members for food or shelter. Marine borers are found in sea water and brackish water and cause severe damage to timber members in the area between high and low water, although damage may extend to the mud line. (LOCATION)
Infiltration	Infiltration occurs when water is flowing or seeping into the wall through open joints. (LOCATION)
Leaching	The action of removing substances from a material by passing water through it. (LOCATION)
Leakage	Evidence of water seepage through the joints or due to other defects such as cracking and spalling of concrete (PER LOCATION)
Marine Growth	Chemical secretions from rock-boring mollusks deteriorate stone causing marine growth.
Masonry Displacement	The moving of any type of masonry from its original as built position. (INCH)
Mortar Breakdown	The loss of material and leading to weakness of cement. (SQUARE FEET)
Paint-peeling	When the paint is starting to wear away, exposing the material underneath. (SQUARE FEET)
Rust Staining	An elimination of the protective coating of reinforcing steel by formation of iron oxide layer due to the intrusion of chlorides. (LOCATION)
Rutting	Formation of grooves or depressions in the ground surface in the vicinity of the wall due to factors such as soil movement, erosion, and / or vehicular traffic. (INCH)
Scaling	Scaling is the gradual and continuing loss of surface mortar and aggregate over an area due to the chemical breakdown of the cement bond. (SQUARE FEET)
Scour	The removal of sediment such as sand and rocks from around bridge abutments and piers caused by swiftly moving water. (SQUARE FEET)
Section Loss	Reduction of structural material reducing the load carrying capacity of structural member. (SQUARE FEET OR PERCENTAGE)

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

TABLE 1. DEFICIENCIES AND DEFINITIONS

Deficiency	Definition and Unit of Measurement
Separation	A gap between the panels of wall. (INCH)
Settlement	Ground Settlement: Sinking or lowering of the ground surface in the immediate vicinity of the wall caused by a change in stress distribution in the soil due to the construction of the wall or loss of soil due to erosion. (INCH) Roadway Settlement: Sinking or displacement of the road surface adjacent to or atop the wall due to factors, such as poor initial compaction, erosion, and / or loading that exceeds design assumptions. (INCH)
Shakes	Separation of the wood fibers parallel to the grain which occurs between the annual growth rings. (LOCATION)
Spalling/Fractures	A spall is a depression in the concrete caused by corroding reinforcement, friction from thermal movement and overstress. Spalls result from the separation and removal of a portion of the surface concrete, revealing a fracture roughly parallel to the surface. (SQUARE FEET)
Splits	Advanced checks that extend completely through the piece of wood. A split is also known as a through check. (PER LOCATION)
Undermining	Scour can cause undermining which is the removal or scouring away of supporting foundation material from beneath the substructure unit when streams or rivers flow adjacent to them. (SQUARE FEET OR PERCENTAGE)
Vegetation Growth	Any vegetation growth, including trees or vines, that surrounds and/or grows on a structure, interfering with the visual inspections, should be removed by the inspector. If the vegetation is too extensive, coordination with the Authority's Maintenance Department is recommended for its removal.
Vertical Movement or Settlement	Vertical movement can occur in the form of uniform or differential settlement. Differential settlement can produce severe distress which varies in magnitude based upon the length of structure. Common causes of vertical movement are soil bearing failure, consolidation of soil and undermining causing the structure to drop deeper into the ground. (INCH)
Vertical Rotation	The vertical rotation can occur due to differential settlement, undermining, scour saturation of backfill, soil bearing failure, erosion of backfill along the sides of the abutment, and improper design. (DEGREES)
Weathering	Hard surfaces degenerate into small granules, giving stones a smooth, rounded look; mortar disintegrates. (SQUARE FEET)

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

C. REPAIR CATEGORIES

Based on the degree of deterioration noted to the structural elements of the retaining wall or noise barrier, a repair Category is assigned for each element exhibiting details requiring a recommendation.

Repair categories which apply to retaining walls and/or noise barriers are as follows:

TABLE 2. REPAIR CATEGORIES

Category	Description
N/A	Contract repair has not been recommended
A	<p>Category A Deficiencies that require prioritized attention with prompt notification given to the Authority.</p> <p><u>Category A1 Emergency:</u></p> <ul style="list-style-type: none"> – Slope Failure due to excessive erosion of backfill material. – Substantial tilting of the Retaining Wall or Noise Barrier. – Major deterioration or other conditions which affect the stability of the Retaining Wall or Noise Barrier. – Failure of foundation elements. – Significant horizontal or vertical movement of a Retaining Wall or Noise Barrier. – Indication of tension cracks in the ground above/behind MSE walls and/or toe heave in front of the MSE wall. <p><u>Category A2 Priority:</u></p> <ul style="list-style-type: none"> – Wide crack in a Retaining Wall or Noise Barrier. – Large delaminations or spalls on concrete or masonry wall facing (may include cleaning of rebar). – Deterioration of primary structural elements in a Retaining Wall or Noise Barrier. – Leakage through expansion joint seals. – Erosion/scour holes around wall. <p><u>Category A3 Priority (Non-Structural):</u></p> <ul style="list-style-type: none"> – Issues noted which are recommended for repair before or within the next regularly scheduled contract as they pose a potential safety concern to the travelling public. <p><u>Guide Rail:</u></p> <ul style="list-style-type: none"> – Damage or significant corrosion noted to guide rail elements including attachments to structures, rail and posts and end terminals at Turnpike and Parkway structures, which require repair in the near future are reported by the issuance of a Guide Rail Type Category A Report. <p><u>Utility:</u></p> <ul style="list-style-type: none"> – Damage or significant corrosion noted to Authority and outside agency utility supports, pipes/conduits and connections at Turnpike and Parkway structures, which require repair in the near future are reported by the issuance of a Utility Type Category A Report.

TABLE 2. REPAIR CATEGORIES

Category	Description
B	Contract work Deficiencies noted that are recommended for repair by an annual Bridge Repair Contract or Specialized Repair Contract as part of the Authority's Capital Budget Program.
	– Repair/replacement of impact damaged panel(s) in retaining wall or noise barrier
E	Monitor Noted deficiencies or conditions that are considered actively developing and may be recommended for contract work, but require monitoring until the condition has been remedied. This monitoring would involve an increased inspection frequency and/or level of detail through routine or interim inspections.
	– Displacement, rotation, and settlement / differential settlement

Repair categories which apply to retaining walls and/or noise barriers are as follows:

For additional details refer to the Authority's Deficiency Category Document (ADCD) at <https://www.njta.com/media/5394/authority-deficiency-category-definitions-v20-6-2020.pdf> and Section 9.D. for details of MSE wall inspections.

D. OVERALL RETAINING WALL AND NOISE BARRIER CONDITION

The overall condition evaluation implemented for retaining walls and noise barriers was derived from the Recording and Coding Guide for the Structure Inventory and Appraisal of the Nation's Bridges (FHWA). Based on the inspection findings, the following four condition states are to be used when evaluating the overall condition of retaining walls and noise barriers.

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

TABLE 3. OVERALL CONDITION RATING OF STRUCTURE

Rating	Description
Good	<p>Distress present does not significantly compromise the structure function, nor is there significant severe distress to major structural components.</p> <p>Ratings of Good indicate highly functioning structures that are only beginning to show the first signs of distress or weathering.</p>
Fair	<p>Distress present does not compromise structure function, but lack of treatment may lead to impaired function and/or elevated risk of structure failure in the near term.</p> <p>Ratings of Fair indicate functioning structures with specific distresses that need to be mitigated in the near term to avoid significant repairs or element replacement in the longer term.</p> <p>Repairs may be necessary.</p> <p>Examples of Defects:</p> <p>MSE – Bulging or deformation, cracking, drainage defects, slope erosion, wall panel displacement, vegetation growth, facing deterioration, loss of soil fill</p> <p>Concrete – spalling, cracking, leaching, scaling, delamination.</p> <p>Timber – weathering or splitting</p> <p>Steel – corrosion, paint failure, section loss, missing or loose connections</p> <p>Masonry – cracking, freeze-thaw</p> <p>MVA – Motor vehicle accident</p>

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

Rating	Description
Poor	<p>Distress present threatens structure function, and strength is compromised and/or structural analysis is warranted.</p> <p>The structure condition does not pose an immediate threat to wall stability and closure is not necessary.</p> <p>Ratings of Poor indicate marginally functioning, severely distressed structures in jeopardy of failing without repair or replacement in the near term.</p> <p>Repair or replacement is required.</p> <p>Close monitoring is recommended at deteriorated structural elements until repairs are completed.</p> <p>Examples of Defects: MSE – Bulging or deformation, cracking, corrosion of reinforcements, inadequate drainage, soil erosion, wall panel displacement, vegetation growth, facing deterioration, loss of soil fill Concrete – spalling, cracking, leaching, scaling, delamination Timber – weathering, splitting, rot, decay Steel – corrosion, paint failure, section loss, missing or loose connections Masonry – cracking, freeze-thaw, mortar breakdown MVA – Motor vehicle accident</p>
Critical	<p>Structure is no longer serving intended function.</p> <p>Structure performance is threatening overall stability at the time of inspection.</p> <p>Ratings of Critical indicate a structure that is no longer functioning as intended, and is in danger of failing at any time.</p> <p>Requires Immediate repair or removal and the issuance of a Category A Report.</p> <p>Retaining walls supporting the roadway must be closely monitored and the roadway carrying traffic supported by the wall should be closed until repairs are completed.</p>

MSE WALLS – THRESHOLDS FOR ACTION

When defects are noted during the inspection of MSE walls which warrant more frequent monitoring (Category E) the following criteria should be used to trigger when long-term monitoring and repair procedures defined below should commence.

Defects	Description
Displacement	<ul style="list-style-type: none"> – Top of wall displacement in excess of 1.5% of the wall height or 4" max, whichever is less, determined by survey or using plumb bobs. – Bulging of the wall in excess of 1.5", determined by survey or using a 6' straight edge and ruler. – Changes in top of wall displacement from previous inspection (6-year cycle) of more than 0.5".
Rotation	<ul style="list-style-type: none"> – Wall rotation in excess of 0.5 degrees for walls taller than 25 feet or wall rotation in excess of 1.0 degree for walls 25 feet or less in height. Field measured using a clinometer to measure the inclination along a 6-foot straight edge or by survey. – Changes in wall rotation in excess of 0.2 degrees observed from the previous inspection (6-year cycle).
Settlement / Differential Settlement	<ul style="list-style-type: none"> – Post construction settlement in excess of 2". – Post construction differential settlement in excess 1/200 (AASHTO C11.11.3). – Review the existing soil borings to assess the likelihood of time dependent settlement (i.e., wall is underlain by clays or organic soils). – Look for indications of settlement such as differential facing joint openings or for signs of migration of soil from pipe, utility, or water flow. – If settlement is anticipated based on the two bullets above, perform baseline survey measurements during initial condition survey, with northing, easting, and elevation measured at top of wall, every 200 feet along the wall or a minimum of 3 locations, whichever is greater. – Resurvey the same points at each 6-year cycle to assess settlement and differential settlement. – The tolerable magnitude of settlement shall be assessed on an individual location basis considering adjacent bridge overhead clearances (i.e for MSE abutments).

Long Term Monitoring and Repair Procedures

The long-term monitoring and repair procedure defined below is to be performed as soon as possible, ideally within a 30 day time frame for monitoring, exploration, and analysis to be performed for MSE Walls. This shall include:

- **Monitoring**
 - Monitor the wall for rotation and temperature at a minimum interval of monthly for a six month period. If the wall continues to rotate (other than rotations which appear to be cyclical thermal fluctuations) during the six month period, install tiltmeters to continuously monitor the wall with data reported at a 15 minute increment. Equipment for monitoring wall rotation shall have an accuracy of ± 0.003 degrees within ± 5 degree tilt range or an accuracy of ± 0.010 degrees within a ± 15 degree tilt range.
 - Monitor the wall for settlement at a minimum interval of monthly for a six month period.
 - Install crack gauges on facing joints which have aperture of 1" or more and cracks which have aperture of 0.25" or more and monitor monthly for a period of 6 months.

- **Exploration**
 - If the MSE wall included metallic reinforcement (opposed to geosynthetics), perform exploratory test pits (minimum of 3 per wall, or every 250' along the wall, whichever is greater) to verify the condition of the reinforcement (corrosion loss)
 - Use geophysical survey methods to verify the reinforcement length

- **Analysis**
 - Perform limit equilibrium global stability analysis for the drained (long term) and undrained (short term) conditions considering circular and non-circular failure surfaces.
 - Perform MSE wall External Stability calculations including bearing resistance, sliding resistance, eccentricity, and settlement calculations in accordance with AASHTO LRFD BDS.
 - Perform MSE wall Internal Stability calculations considering tensile resistance of reinforcement and pullout resistance of reinforcement in accordance with AASHTO LRFD BDS.

- **Repair or Replacement**
 - Repair or replacement alternatives will be recommended if results of the analysis do not satisfy any of the following AASHTO requirements:
 - Resistance factor of 0.75 ($\sim FS=1.3$) for Global Stability
 - Resistance factor of 0.65 for Bearing Resistance
 - Resistance factor of 1.00 for Sliding Resistance

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

- Resistance factor of 0.75 for strip reinforcement tensile resistance
- Resistance factor of 0.65 for grid reinforcement tensile resistance
- Resistance factor of 0.90 for Pullout Resistance
- Eccentricity as AASHTO LRFD BDS requirements
- Repair alternatives to be considered may include the following supplemental elements:
 - Soil nails through each panel or with a supplemental facing
 - Drilled and grouted tieback ground anchors (strand or bar) with walers and/or supplemental facing
 - Deadman with tie rods and walers or supplement facing
 - Rakers and walers
 - Underpinning
 - Toe wall in front of wall
 - Toe berm
 - Excavation and replacement with lightweight fill material
 - Drilled soldier pile and lagging or micropile and lagging wall in front

E. ELEMENT LEVEL INSPECTION

Retaining wall and noise barrier elements represent the primary structural components of a retaining wall and noise barrier necessary to determine the overall condition and safety state of the asset. The retaining wall and noise barrier inspection includes defining the elements and total quantities that exist at each asset. The condition of each element is determined by performing a field inspection and recording quantities of the element that have identified defects that correlate to the severity of the defects defined in the particular condition state. Inspectors should assign Condition States based on the overall condition of the element and its ability to function properly.

The following are the Agency Defined Elements (ADE's):

- 9100-NBRW.01 – Wall/Panel RC
- 9101-NBRW.02 – Wall/Panel Steel
- 9102-NBRW.03 – Wall/Panel Timber
- 9103-NBRW.04 – Wall/Panel Masonry
- 9104-NBRW.05 – Wall/Panel Other
- 9105-NBRW.06 – Vertical Support RC
- 9106-NBRW.07 – Vertical Support Steel
- 9107-NBRW.08 – Vertical Support Timber
- 9108-NBRW.09 – Vertical Support Masonry
- 9109-NBRW.10 – Vertical Support Other
- 9110-NBRW.11 – Construction/Expansion Joint
- 9111-NBRW.12 – Foundation (Exposed Portion)
- 9112-NBRW.13 – Barrier

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

The following protective systems may be applicable in the inspection of a retaining wall and noise barrier:

- 515 – Steel Protective Coating
- 520 – Concrete Reinforcing Steel Protective Coating
- 521 – Concrete Protective Coating

Additionally, the following defects may be applicable in the inspection of a retaining wall and noise barrier:

- 1000 – Corrosion
- 1010 – Cracking
- 1020 – Connection
- 1080 – Delamination/Spall/Patched Area
- 1090 – Exposed Rebar
- 1120 – Efflorescence/Rust Staining
- 1130 – Cracking (RC and Other)
- 1140 – Decay/Section Loss
- 1150 – Check/Shake
- 1160 – Crack (Timber)
- 1170 – Split/Delamination
- 1180 – Abrasion/Wear (Timber)
- 1190 – Abrasion/Wear (PSC/RC)
- 1220 – Deterioration (Other)
- 1610 – Mortar Breakdown (Masonry)
- 1620 – Split/Spall (Masonry)
- 1630 – Patched Area (Masonry)
- 1640 – Masonry Displacement
- 1900 – Distortion
- 2210 – Movement
- 2220 – Alignment
- 2310 – Leakage
- 2320 – Seal Adhesion
- 2330 – Seal Damage
- 2340 – Seal Cracking
- 3410 – Chalking (Steel Protective Coating)
- 3420 – Pelling/Bubbling/Cracking (Steel Protective Coating)
- 3430 – Oxide Film Degradation Color/Texture Adherence (Steel Protective Coating)
- 3440 – Effectiveness (Steel Protective Coating)
- 3510 – Wear (Concrete Protective Coating)
- 3540 – Effectiveness (Concrete Protective Coating)

New Jersey Turnpike Authority
Manual for Retaining Wall and Noise Barrier Inspection

- 3600 – Effectiveness – protective System (e.g. cathodic)
- 4000 – Settlement
- 6000 – Scour
- 7000 – Damage
- 8001 – Erosion/Undermining (Slope Protection)
- 9910 – Bulging
- 9920 – Vertical Rotation
- 9930 – Horizontal Rotation
- 9940 – Separation
- 9950 – Graffiti
- 9960 – Vegetation Growth
- 9990 – Freeze-thaw Damage

All elements have four defined condition states:

- Condition State 1 – Good
- Condition State 2 – Fair
- Condition State 3 – Poor
- Condition State 4 – Critical

Refer to Table 3 (Overall Condition Rating of Structure) for general descriptions of the condition states, and refer to the AASHTO Manual for Bridge Element Inspection (AMBEI) for detailed element guidance and condition state examples.

10. QUALITY CONTROL AND QUALITY ASSURANCE REVIEWS

Refer to Appendix A of the Authority's Bridge Inspection Program Quality Management Plan (QMP) for quality control and quality assurance reviews and Retaining Wall and Noise Barrier Inspection Checklists.

https://www.njta.com/media/5606/2020-08-28-bi-program-quality-management-plan_v12-final.pdf.

11. REPORTING OF EMERGENCY DEFICIENCIES

Refer to the Authority Deficiency Category Definitions document to identify the severity of deficiencies noted in retaining wall and noise barrier inspection reports which help in future planning of Maintenance and Contract Improvements.

<https://www.njta.com/media/5394/authority-deficiency-category-definitions-v20-6-2020.pdf>

OVERALL RATING:

GENERAL REMARKS:

No contract repairs are recommended for this structure.

SCHEDULED/ONGOING OR COMPLETED WORK:

This structure has no scheduled, ongoing or work done since the previous inspection.

CATEGORY A:

If no items warrant discussion enter "N/A".

CATEGORY 'E' MONITORING:

There are no deficiencies which require monitoring at this time.

This legend relates to the overall rating of the components:

<i>Rating</i>	<i>Description</i>
<i>1</i>	<i>Good: Distress present does not significantly compromise the structure function, nor is there significant severe distress to major structural components. Ratings of Good indicate highly functioning structures that are only beginning to show the first signs of distress or weathering.</i>
<i>2</i>	<i>Fair: Distress present does not compromise structure function, but lack of treatment may lead to impaired function and/or elevated risk of structure failure in the near term. Ratings of Fair indicate functioning structures with specific distresses that need to be mitigated in the near term to avoid significant repair or replacement in the longer term.</i>
<i>3</i>	<i>Poor: Distress present threatens structure function, and strength is compromised and/or structural analysis is warranted. The structure condition does not pose an immediate threat to wall stability and closure is not necessary. Ratings of Poor indicate marginally functioning, severely distressed structures in jeopardy of failing without repair or replacement in the near term.</i>
<i>4</i>	<i>Critical: Structure is no longer serving intended function. Structure performance is threatening overall stability at the time of inspection. Ratings of Critical indicate a structure that is no longer functioning as intended, and is in danger of failing at any time.</i>

This legend relates to the site inspection section:

<i>Repair</i>	<i>Description</i>
<i>N/A:</i>	<i>Contract repair has not been recommended</i>
<i>A:</i>	<i>Category A</i>
<i>B/C:</i>	<i>Contract work</i>

REPORT CHECKLIST QCF 1.6 - RETAINING WALL/NOISE BARRIER CHECKLIST

CONSULTANT INSPECTECH REPORT QUALITY CONTROL REVIEW

QA/QC:

Date:

Number of most recent notification:

General

Contract History

Add list of construction contracts which have worked on the retaining wall or noise barrier.

Work Done

Check for work done on the retaining wall or noise barrier between inspection cycles. Go to the Maintenance tab for Category A's, the Asset Info Tab for History/Notes, and the Quick View for Contract Information.

Note: Only Open Category A Reports are shown on the Maintenance Tab you must check the box to show completed maintenance items and include any information for work completed since the previous inspection.

Photographs

Order of Photographs

General Photos: Elevation (2: Front Face and Rear Face for NB, or RW with fill/slope behind, Front Face and Top of Roadway for Retaining Wall Supporting Roadways)

Category A Photos: A1, A2, A3, GR, Utility

Defect Photos (In order of field notes): Wall Facing/Panel, Vertical Support, Construction/Expansion Joint, Foundation, Anchorage, Connection, Roadway Carried Above Wall, Roadway Along Front of Wall, Guide Rail, Barrier, Fence, Lighting Standards and Junction Boxes, ROW Security, Drainage, Utilities, Housekeeping

Work done photos are incorporated with defect photos by element.

Equipment and MPT Photos (If they have not already been included). It is preferred that equipment photo is taken while equipment is in use.

Defect Photos

Upload photos of all defects particularly those that require monitoring to the asset files. Only typical / representative defect photos need to be included in the Photographs Report Section. Photo references should be included in the field forms when a repair is recommended (A or B) else leave blank and include representative defect photo in photographs section only.

Report Sections

Category A Reports

Select to include all open Category A Reports and reports completed since last inspection with the current inspection report on the Category A report form.

Underwater Inspection Report/Soundings Survey

Add Underwater Inspection Report or Soundings Survey as a PDF attachment to the Report Sections.

File Uploads

Field Sketches

Upload Field Sketches to "File". Applicable only when the template for the field sketch is used to collect data during the inspection.

Working Files

Upload all working files to their own File Type. This includes: underwater inspection report or soundings survey, field sketches, etc.

Final Report

Upload the Final Report PDF to "NBIS Report".

Drawings

Upload As-Built contract drawings and Shop Drawings for MSE Walls to the "Drawing" file type.

General

Work Done

Check for work done on the structure between inspections. Go to the Maintenance tab for Category A's, the Asset Info Tab for History/Notes, and the Quick View for Contract Information.

Note: Only Open Category A Reports are shown on the Maintenance Tab you must check the box to show completed maintenance items and include any information for work completed since the previous inspection.

Attachment(s)

Additional report sections, as applicable, including but not limited to field notes, sketches, tables, plans, or other necessary documents to supplement the write up.

Structural Inventory & Appraisal Forms

To be edited / updated when Interim Inspection Date (Item 93C) is coded to reflect the most recent inspection date or a change in frequency of inspection (92C) is required.

Category A Report

To be included when the deficiency being monitored warrants prioritized repair. To be created once and updated during subsequent inspections to reflect changes in condition or memorialize work done.

Photographs

All photos taken should be uploaded to the Pics / Files page under Photographs. Select representative photos should be included in the report, the cover photo should reflect the typical element / deficiency.

Working Files

Upload all working files to their own File Type.

Final Report

Upload the Final Report PDF to "NBIS Report".

DAMAGE INSPECTION FINDINGS

INSPECTION CONSULTANT: PKB in association with HNTB Corporation

TEAM LEADER:

ASSISTANT TEAM LEADER:

SUPPORT STAFF:

INSPECTION DATE(S): 05/05/2022

WEATHER:

AIR TEMPERATURE: DEGREES F

SPECIAL EQUIPMENT: PHOTO NO(S):

MPT: PHOTO NO(S):

NJTA PERSONNEL PRESENT DURING INSPECTION:

None

SEQUENCE OF EVENTS:

Unknown vehicle struck parapet supporting noise barrier at MP 87.8 in the NSO Roadway.

INSPECTION FINDINGS:

Barrier Section 19 exhibits spalls with exposed rebar / delaminations / hollow sounding concrete (3'-2" H x 1'-5" W x up to 6" D and 6.5" L x 4.5" W x 2.5" D) and multiple fractures (up 3'-7" L x 1-1/2" W x up to 1'-4" D (max ruler penetration)) adjacent to Vertical Support Post 19 (DSCN5383, DSCN5392, DSCN5386, DSCN5390, DSCN5391).

Vertical Support Post 19 exhibits spalls, hollow sounding concrete and cracks (two areas – 2'-4" H x 11" W x 1" D and 10" H x 11" W x up to 1-1/2" D) on the north, south, and west faces on the backside of the post (DSCN5396, DSCN5397, DSCN5398).

The bottom noise barrier panel in section 19 is fractured (1'-11" L x 1/2" W) at the top north corner (DSCN5401).

RECOMMENDATIONS:

It is recommended that the damaged barrier section be replaced in kind. Once the noise barrier panels and parapet barrier section are removed, further inspection can be performed to determine if any repair is needed for Vertical Support Post 19. The small spall at the lowest noise barrier panel should also be repaired. Concrete debris along the right shoulder of the Turnpike NSO Roadway should be cleared by the Authority's Maintenance Department

MEMBERS REQUIRING INTERIM INSPECTION: None

FREQUENCY OF INTERIM INSPECTION: N/A

FINAL DAMAGE INSPECTION REPORT SENT TO:
